

Relating Linear Equations and Their Graphs

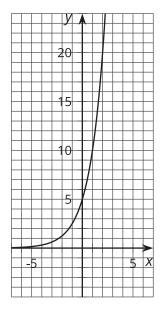

Let's connect functions to features of their graphs.

10.1

Notice and Wonder: Features of Graphs

Here are graphs of y = 2x + 5 and $y = 5 \cdot 2^x$.

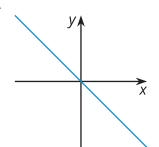

What do you notice? What do you wonder?

10.2

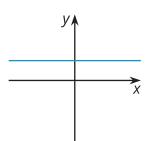

Making Connections

1. Here are some equations and graphs. Match each graph to one or more equations that it *could* represent. Be prepared to explain how you know.

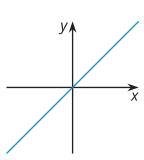

Α

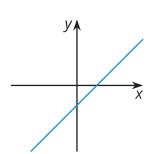

В

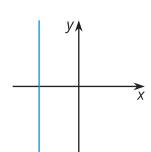

C

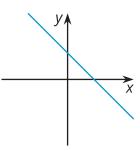

D

Ε

F

$$y = 8$$

$$y = 3x - 2$$

$$x + y = 6$$

$$0.5x = -4$$

$$\circ$$
 $v = x$

$$\circ \quad -\frac{2}{3}x = y$$

$$\circ 12 - 4x = y$$

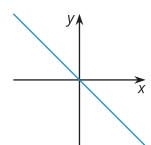

$$x - y = 12$$

$$2x + 4y = 16$$

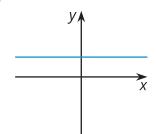

$$\circ$$
 $3x = 5y$

- 2. Choose either Graph D or F. Let x represent hours after noon on a given day and y represent the temperature in degrees Celsius in a freezer.
 - \circ In this situation, what does the \emph{y} -intercept mean, if anything?
 - In this situation, what does the *x*-intercept mean, if anything?

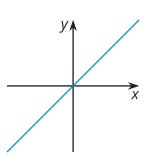

Α

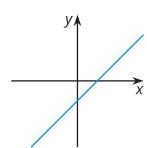

В

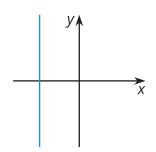

C

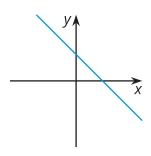

D

Ε

F

1. Without substituting any values for x and y or using technology, decide whether Graph A could represent each equation, and explain how you know.

a.
$$4x = y$$

b.
$$x - 8 = y$$

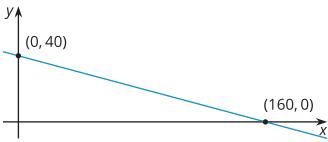

c.
$$-5x = 10y$$

d.
$$3y - 12 = 0$$

2. Write a new equation that could be represented by:

- a. Graph D
- b. Graph F

3. On this graph, x represents minutes since midnight and y represents temperature in degrees Fahrenheit.

- a. Explain what the intercepts tell us about the situation.
- b. Write an equation that relates the two quantities.
