	Refine and Share Your Model		Use Your Model to Reach a Conclusion	C	SK:			
<ul> <li>To improve at this skill, you could:</li> <li>Think more creatively about what your conclusions mean: Ask yourself "If I was involved in this situation, what would I understand better because of these conclusions? What would I want to do next?"</li> <li>Be skeptical of your model: What don't you like about it, and what can you do to fix those things?</li> <li>Explain your model to someone else: Tell them how it works and why it's good. If you're not sure how it works or why it's good, you might need to change it.</li> </ul>	To improve at this skill, you could:  Double-check your calculations: Show calculations again later  Make sure your calculations are justifie reasoning matches up with your model. Think more deeply about what your conclusions to scenario, or explain your conclusions to scenario, or explain your conclusions to the model's implications are clearly stated.  The limitations of the model and solution are addressed.  To improve at this skill, you could:  To improve at this skill, you could:  To improve at this skill, you could:  Be skeptical of your model: What don't	<ul> <li>Solution is relevant to original problem.</li> <li>Reader can easily understand the reasoning leading to the solution.</li> <li>Relevant details are included like units of measure.</li> </ul>	Proficient					
	could: y about what your conclusions mean: Ask yourself "If I we cause of these conclusions? What would I want to do ne model: What don't you like about it, and what can you do o someone else: Tell them how it works and why it's good to change it.	The limitations of the model and solution are addressed but lacking in depth or ignoring key components.	tions: Show them to someone else to ns are justified by your model: Ask you nyour model what your conclusions mean in the origonclusions to someone else and see i	<ul> <li>Solution is not well-aligned to original problem, or aspects of the solution are difficult to understand or incomplete.</li> </ul>	Developing	Score		
		<ul> <li>No interpretation of model and solution is provided.</li> </ul>		<ul> <li>No solution is provided.</li> </ul>	Needs Revisiting			
		see if they agree, or take a break and look at your irself how you decided what to calculate, and see if your ginal scenario: Imagine you're a person involved in the if they have questions			Notes or Comments			

## **Advice on Modeling**

These are some steps that successful modelers often take, and questions that they ask themselves. You don't necessarily have to do all of these steps, or do them in order. Only do the parts that you think will help you make progress.

#### **Understand the Question**

Think about what the question means before you start making a strategy to answer it. Are there words you want to look up? Does the scenario make sense? Is there anything you want to get clearer on before you start? Ask your classmates or teacher if you need to.

#### **Refine the Question**

If necessary, rewrite the question you are trying to answer so that it is more specific.

### Estimate a Reasonable Answer

If you don't have enough information to decide what's reasonable, try to come up with an answer that would be too low, and an answer that would be too high.

### **Identify Unknowns**

- What are the meaningful quantities in this situation? Write them
  down
- What information would be useful to know? In order to get that information, you could: look it up, take a measurement, or make an assumption.

#### Gather Information

Write down any of the unknown information that you find. As you work, organize your information in a way that makes sense to you.

### **Experiment!**

Try different ideas to make progress toward answering your question. If you are stuck, think about:

- Helpful ways to organize the information you have or organize your work
- Questions you *can* answer using the information you have
- Ways to represent mathematical relationships or sets of data (tables, equations, scatter plots, graphs, statistical plots)
- Tools that are available for representing mathematics, both digital and analog

### **Check Your Reasoning**

Do you have a first answer to your question? Great! See if it's reasonable.

- Make sure you can explain what the answer means in terms of the original problem.
- Check your precision: Is your answer overly precise (do you really need all those decimal places)? Not precise enough (were you overly aggressive with your rounding)?

## **Use and Improve Your Model**

- Did you make assumptions or measurements? How can you express your model more generally, so that it would work for a range of numbers instead of the specific numbers you used?
- What are the limitations of your model? That is, what are some ways it is not realistic? Does it only work for certain inputs but not others? Are there any meaningful inputs affecting the outcome that are not accounted for? If possible, improve your model to take these into account.
- What are the implications of your model? That is, what should people or organizations do differently or smarter as a result of what your model shows? What would be effective ways to communicate with them?
- What are the areas for further research? That is, what new things are you wondering about that could be investigated, by you or someone else?
