Swing Time

Task Statement 1

In the early 1600s, Galileo began to study pendulums after noticing that a chandelier in the Tower of Pisa had a regular swinging motion. He later figured out how to design a pendulum that swung back and forth in exactly two seconds, which allowed people to build clocks that used pendulums to keep time. The time it takes a pendulum to complete one back-and-forth swing is called its *period*.

- 1. What variables might affect the period of a pendulum?
- 2. Collect data. Which variable appears to have the greatest effect on the period of the pendulum? Justify your response.
- 3. Create a mathematical model, relating the variable you identified to the period of a pendulum.
- 4. Think carefully about how you decided on the number of digits to record in your measurements. Explain these decisions.
- 5. Use your model to determine the characteristics of a pendulum with a period of 2 seconds.
- 6. Would it be possible to create a pendulum with a period of 1 minute? 1 hour? If so, what would you need to create these pendulums? If not, why not?
- 7. Think carefully about how you decided on the number of digits to include in the lengths of the 2-second, 1-minute, and 1-hour pendulums. Explain these decisions.

Swing Time

Task Statement 2

In the early 1600s, Galileo began to study pendulums after noticing that a chandelier in the Tower of Pisa had a regular swinging motion. He later figured out how to design a pendulum that swung back and forth in exactly two seconds, which allowed people to build clocks that used pendulums to keep time. The time it takes a pendulum to complete one back-and-forth swing is called its *period*.

- 1. What variables might affect the period of a pendulum?
- 2. Collect data. Which variable appears to have the greatest effect on the period of the pendulum? Justify your response.
- 3. Build a pendulum that allows you to adjust the length by making the string longer or shorter. Use your stopwatch to time, in seconds, the period of a pendulum with each length, in inches: 30, 20, 15, 10, 5.0, 3.0, 1.0. Record the period of each pendulum in an organized way.
- 4. Think carefully about how you decided how many digits to record in your measurements. Explain these decisions.
- 5. Use technology to create a scatter plot of your data, placing length, in inches, on the horizontal axis and time, in seconds, on the vertical axis.
- 6. Which model seems like the best fit: linear, quadratic, or square root? Create a model that fits the data.
- 7. Use your model to determine the characteristics of a pendulum with a period of 2 seconds.
- 8. Would it be possible to create a pendulum with a period of 1 minute? 1 hour? If so, what would you need to create these pendulums? If not, why not?
- 9. Think carefully about how you decided on the number of digits to include in the lengths of the 2-second, 1-minute, and 1-hour pendulums. Explain these decisions.
