

# More than That, Less than That

Let's use fractions to describe increases and decreases.

## 4.1 Notice and Wonder: Tape Diagrams

What do you notice? What do you wonder?

## 4.2 Walking Half as Much Again

1. Complete the table to show the total distance walked in each case.

- a. Jada's pet turtle walked 10 feet and then half that length again.
- b. Jada's baby brother walked 3 feet and then half that length again.
- c. Jada's hamster walked 4.5 feet and then half that length again.
- d. Jada's robot walked 1 foot and then half that length again.
- e. A person walked  $x$  feet and then half that length again.

| initial distance | total distance |
|------------------|----------------|
| 10               |                |
| 3                |                |
| 4.5              |                |
| 1                |                |
| $x$              |                |

2. Explain how you computed the total distances for these cases.

3. Two students each wrote an equation to represent the relationship between the initial distance walked ( $x$ ) and the total distance walked ( $y$ ).

- Mai wrote  $y = x + \frac{1}{2}x$ .
- Kiran wrote  $y = \frac{3}{2}x$ .

Do you agree with either of them? Explain your reasoning.

### Are you ready for more?

Zeno jumped 8 meters. Then he jumped half as far again (4 meters). Then he jumped half as far again (2 meters). So after 3 jumps, he was  $8 + 4 + 2 = 14$  meters from his starting place.

1. Zeno kept jumping half as far again. How far would he be after 4 jumps? 5 jumps? 6 jumps?
2. Before he started jumping, Zeno put a mark on the floor that was exactly 16 meters from his starting place. How close can Zeno get to the mark if he keeps jumping half as far again?
3. If you enjoyed thinking about this problem, consider researching Zeno's Paradox.

## 4.3 Card Sort: Fractional Relationships

Your teacher will give you a set of cards. Take turns with your partner to match a description with an equation and a tape diagram.

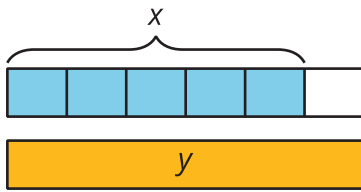

1. For each match that you find, explain to your partner how you know it's a match.
2. For each match that your partner finds, listen carefully to their explanation. If you disagree, discuss your thinking, and work to reach an agreement.

## 4.4

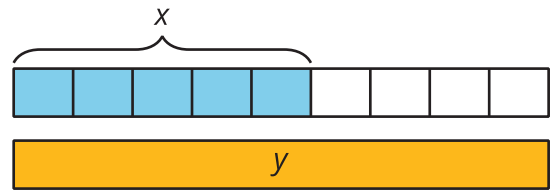

## More and Less

1. Match each situation with a diagram. A diagram may not have a match.

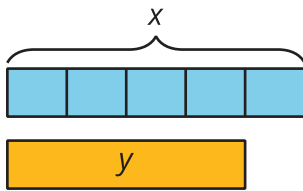

**A**

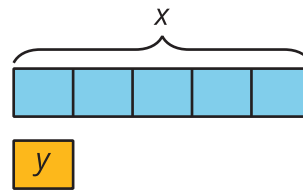

**B**

**C**

**D**

- Han slept for  $x$  hours. Mai slept  $\frac{1}{5}$  less than that.
- Mai biked  $x$  miles. Han biked  $\frac{4}{5}$  more than that.
- Han bought  $x$  pounds of books. Mai bought  $\frac{4}{5}$  of that.

2. For each diagram, write an equation that represents the relationship between  $x$  and  $y$ .

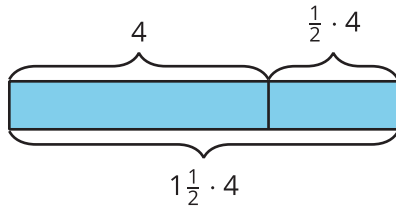

- Diagram A:
- Diagram B:
- Diagram C:
- Diagram D:

3. Write a story for one of the diagrams that doesn't have a match.

## Lesson 4 Summary

Using the distributive property provides a shortcut for calculating the final amount in situations that involve adding or subtracting a fraction of the original amount.

For example, one day Clare runs 4 miles. The next day, she plans to run that same distance plus half as much again. How far does she plan to run the next day?

Tomorrow she will run 4 miles plus  $\frac{1}{2}$  of 4 miles. We can use the distributive property to find this in one step:

$$1 \cdot 4 + \frac{1}{2} \cdot 4 = \left(1 + \frac{1}{2}\right) \cdot 4$$

Clare plans to run 6 miles, because  $1\frac{1}{2} \cdot 4 = 6$ .

This works when we decrease by a fraction, too. If Tyler spent  $x$  dollars on a new shirt, and Noah spent  $\frac{1}{3}$  less than Tyler, then Noah spent  $\frac{2}{3}x$  dollars since  $x - \frac{1}{3}x = \frac{2}{3}x$ .
