

Lesson 11: Representing Ratios with Tables

Let's use tables to represent equivalent ratios.

11.1: How Is It Growing?

Look for a pattern in the figures.

- 1. How many total tiles will be in:
 - a. the 4th figure?
 - b. the 5th figure?
 - c. the 10th figure?
- 2. How do you see it growing?

11.2: A Huge Amount of Sparkling Orange Juice

Noah's recipe for one batch of sparkling orange juice uses 4 liters of orange juice and 5 liters of soda water.

- 2. If someone mixes 36 liters of orange juice and 45 liters of soda water, how many batches would they make?
- 3. If someone uses 400 liters of orange juice, how much soda water would they need?
- 4. If someone uses 455 liters of soda water, how much orange juice would they need?
- 5. Explain the trouble with using a double number line diagram to answer the last two questions.

11.3: Batches of Trail Mix

A recipe for trail mix says: "Mix 7 ounces of almonds with 5 ounces of raisins." Here is a **table** that has been started to show how many ounces of almonds and raisins would be in different-sized batches of this trail mix.

almonds (oz)	raisins (oz)
7	5
28	
	10
3.5	
	250
56	

- 1. Complete the table so that ratios represented by each row are equivalent.
- 2. What methods did you use to fill in the table?
- 3. How do you know that each row shows a ratio that is equivalent

to 7:5? Explain your reasoning.

Are you ready for more?

You have created a best-selling recipe for chocolate chip cookies. The ratio of sugar to flour is 2 : 5.

Create a table in which each entry represents amounts of sugar and flour that might be used at the same time in your recipe.

- One entry should have amounts where you have fewer than 25 cups of flour.
- One entry should have amounts where you have between 20–30 cups of sugar.
- One entry can have any amounts using more than 500 units of flour.

Lesson 11 Summary

A **table** is a way to organize information. Each horizontal set of entries is called a *row*, and each vertical set of entries is called a *column*. (The table shown has 2 columns and 5 rows.) A table can be used to represent a collection of equivalent ratios.

Here is a double number line diagram and a table that both represent the situation: "The price is \$2 for every 3 mangos."
