

Weighted Averages

Let's split segments using averages and ratios.

15.1 Part Way: Points

For the questions in this activity, use the coordinate grid if it is helpful to you.

1. What is the midpoint of the segment connecting $(1, 2)$ and $(5, 2)$?
2. What is the midpoint of the segment connecting $(5, 2)$ and $(5, 10)$?
3. What is the midpoint of the segment connecting $(1, 2)$ and $(5, 10)$?

15.2 Part Way: Segment

Point A has coordinates $(2, 4)$. Point B has coordinates $(8, 1)$.

1. Find the point that partitions segment AB in a $2 : 1$ ratio.
2. Calculate $C = \frac{1}{3}A + \frac{2}{3}B$.
3. What do you notice about your answers to the first 2 questions?
4. For 2 new points K and L , write an expression for the point that partitions segment KL in a $3 : 1$ ratio.

 Are you ready for more?

Consider the general quadrilateral $QRST$ with $Q(0, 0)$, $R(a, b)$, $S(c, d)$, and $T(e, f)$.

1. Find the midpoints of each side of this quadrilateral.
2. Show that if these midpoints are connected consecutively, the new quadrilateral formed is a parallelogram.

15.3 Part Way: Quadrilateral

Here is quadrilateral $ABCD$.

1. Find the point that partitions segment AB in a 1 : 4 ratio. Label it B' .
2. Find the point that partitions segment AD in a 1 : 4 ratio. Label it D' .
3. Find the point that partitions segment AC in a 1 : 4 ratio. Label it C' .
4. Is $AB'C'D'$ a dilation of $ABCD$? Justify your answer.

Lesson 15 Summary

To find the midpoint of a line segment, we can average the coordinates of the endpoints. For example, to find the midpoint of the segment from $A(0, 4)$ to $B(6, 7)$, average the coordinates of A and B : $\left(\frac{0+6}{2}, \frac{4+7}{2}\right) = (3, 5.5)$. Another way to write what we just did is $\frac{1}{2}(A + B)$ or $\frac{1}{2}A + \frac{1}{2}B$.

Now, let's find the point that is $\frac{2}{3}$ of the way from A to B . In other words, we'll find point C so that segments AC and CB are in a 2 : 1 ratio.

In the horizontal direction, segment AB stretches from $x = 0$ to $x = 6$. The distance from 0 to 6 is 6 units, so we calculate $\frac{2}{3}$ of 6 to get 4. Point C will be 4 horizontal units away from A , which means an x -coordinate of 4.

In the vertical direction, segment AB stretches from $y = 4$ to $y = 7$. The distance from 4 to 7 is 3 units, so we can calculate $\frac{2}{3}$ of 3 to get 2. Point C must be 2 vertical units away from A , which means a y -coordinate of 6.

It is possible to do this all at once by saying $C = \frac{1}{3}A + \frac{2}{3}B$. This is called a weighted average. Instead of finding the point in the middle, we want to find a point closer to B than to A . So we give point B more weight—it has a coefficient of $\frac{2}{3}$ rather than $\frac{1}{2}$ as in the midpoint calculation. To calculate $C = \frac{1}{3}A + \frac{2}{3}B$, substitute and evaluate.

$$\begin{aligned}\frac{1}{3}A + \frac{2}{3}B \\ \frac{1}{3}(0, 4) + \frac{2}{3}(6, 7) \\ \left(0, \frac{4}{3}\right) + \left(4, \frac{14}{3}\right) \\ (4, 6)\end{aligned}$$

Either way, we found that the coordinates of C are $(4, 6)$.
