

## Lots of Lines (Part 1)

**Narrator:** Diego, Jada, and Noah were given the following task: “Prove that if a point  $C$  is the same distance from  $A$  as it is from  $B$ , then  $C$  must be on the perpendicular bisector of  $AB$ .” At first they were really stuck.

**Noah:** How do you prove a point is on a line?

**Narrator:** Their teacher gave them the hint, “Another way to think about it is to draw a line that you know  $C$  is on, and prove that line has to be the perpendicular bisector.” They each drew a line and thought about their pictures.

**Diego:** I drew a line through  $C$  that was perpendicular to  $AB$  and through the midpoint of  $AB$ . That line is the perpendicular bisector of  $AB$  and  $C$  is on it, so that proves  $C$  is on the perpendicular bisector.”

**Jada:** I thought the line through  $C$  would probably go through the midpoint of  $AB$  so I drew that and labeled the midpoint  $D$ . Triangle  $ACB$  is isosceles, so angles  $A$  and  $B$  are congruent, and  $AC$  and  $BC$  are congruent. And  $AD$  and  $DB$  are congruent because  $D$  is a midpoint. That made two congruent triangles by the Side-Angle-Side Triangle Congruence Theorem. So I know angle  $ADC$  and angle  $BDC$  are congruent, but I still don’t know if  $DC$  is the perpendicular bisector of  $AB$ .

**Noah:** In the Isosceles Triangle Theorem proof, Mai and Kiran drew an angle bisector in their isosceles triangle, so I’ll try that. I’ll draw the angle bisector of angle  $ACB$ . The point where the angle bisector hits  $AB$  will be  $D$ . So triangles  $ACD$  and  $BCD$  are congruent, which means  $AD$  and  $BD$  are congruent, so  $D$  is a midpoint and  $CD$  is the perpendicular bisector.
