

## Lesson 11 Practice Problems

1. Which of the following criteria *always* proves triangles congruent? Select **all** that apply.

- A. 3 congruent angles
- B. 3 congruent sides
- C. Corresponding congruent Side-Angle-Side
- D. Corresponding congruent Side-Side-Angle
- E. Corresponding congruent Angle-Side-Angle

2. Here are some measurements for triangle  $ABC$  and triangle  $XYZ$ :

- Angle  $ABC$  and angle  $XYZ$  are both  $30^\circ$
- $BC$  and  $YZ$  both measure 6 units
- $CA$  and  $ZX$  both measure 4 units

Lin thinks these triangles must be congruent. Priya says she knows they might not be congruent. Construct 2 triangles with the given measurements that aren't congruent. Explain why triangles with 3 congruent parts aren't necessarily congruent.

3. Jada states that diagonal  $WY$  bisects angles  $ZWX$  and  $ZYX$ . Is she correct? Explain your reasoning,

(From Unit 2, Lesson 9.)

4. Select **all** true statements based on the diagram.

- A. Angle  $CBE$  is congruent to angle  $DAE$ .
- B. Angle  $CEB$  is congruent to angle  $DEA$ .
- C. Segment  $DA$  is congruent to segment  $CB$ .
- D. Segment  $DC$  is congruent to segment  $AB$ .
- E. Line  $DC$  is parallel to line  $AB$ .
- F. Line  $DA$  is parallel to line  $CB$ .

(From Unit 2, Lesson 10.)

5.  $WXYZ$  is a kite. Angle  $WXY$  has a measure of 94 degrees and angle  $ZWX$  has a measure of 112 degrees. Find the measure of angle  $ZYW$ .

(From Unit 2, Lesson 9.)

6. Andre is thinking through a proof using a reflection to show that a triangle is isosceles given that its base angles are congruent. Complete the missing information for his proof.

Construct  $AB$  such that  $AB$  is the perpendicular bisector of segment  $CD$ . We know angle  $ADB$  is congruent to 1.  $DB$  is congruent to 2 since  $AB$  is the perpendicular bisector of  $CD$ . Angle 3 is congruent to angle 4 because they are both right angles. Triangle  $ABC$  is congruent to triangle 5 because of the 6 Triangle Congruence Theorem.  $AD$  is congruent to 7 because they are corresponding parts of congruent triangles. Therefore, triangle  $ADC$  is an isosceles triangle.

(From Unit 2, Lesson 8.)

7. The triangles are congruent. Which sequence of rigid motions takes triangle  $DEF$  onto triangle  $BAC$ ?

- Translate  $DEF$  using directed line segment  $EA$ . Rotate  $D'E'F'$  using  $A$  as the center so that  $D'$  coincides with  $C$ . Reflect  $D''E''F''$  across line  $AC$ .
- Translate  $DEF$  using directed line segment  $EA$ . Rotate  $D'E'F'$  using  $A$  as the center so that  $D'$  coincides with  $C$ . Reflect  $D''E''F''$  across line  $AB$ .
- Translate  $DEF$  using directed line segment  $EA$ . Rotate  $D'E'F'$  using  $A$  as the center so that  $D'$  coincides with  $B$ . Reflect  $D''E''F''$  across line  $AC$ .
- Translate  $DEF$  using directed line segment  $EA$ . Rotate  $D'E'F'$  using  $A$  as the center so that  $D'$  coincides with  $B$ . Reflect  $D''E''F''$  across line  $AB$ .

(From Unit 2, Lesson 3.)
