|--|--|---|
| U1, L3 (students write the date) theorem | Triangle Inequality Theorem: If a triangle has side lengths a , b , and c , then $c < a + b$. |  |
| U1, L7 theorem | Vertical angles are congruent. |  |
| U1, L9 assertion | Rotation by 180 degrees takes lines to parallel lines or to themselves. |  |
| U1, L9 theorem | Alternate Interior Angle Theorem: If two parallel lines are cut by a transversal, then alternate interior angles are congruent. Conversely, if two lines are cut by a transversal and alternate interior angles are congruent, then the lines have to be parallel. |  |
| U1, L9 theorem | Corresponding Angle Theorem: If two parallel lines are cut by a transversal, then corresponding angles are congruent. Conversely, if two lines are cut by a transversal and corresponding angles are congruent, then the lines have to be parallel. |  |

| lesson, type | statement | diagram |
|-----------------------|--|---|
| U1, L10 theorem | Triangle Angle Sum Theorem: The three angle measures of any triangle always sum to 180 degrees. |  $a + b + c = 180$ |
| U1, L12 definition | A rectangle is a quadrilateral with four right angles. |  |
| U1, L12 definition | A rhombus is a quadrilateral with four congruent sides. |  |
| U1, L12 theorem | If a parallelogram has (at least) one right angle, then it is a rectangle. |  <p>$KLMN$ has a right angle so it is a rectangle</p> |
| U2, L1 definition | Scale factor is the factor by which every length in an original figure is multiplied when you make a scaled copy. |  <p>Scale factor is 2 or $\frac{1}{2}$</p> |

| Date, Type | Statement | Diagram |
|----------------------|---|--|
| U2, L1 definition | <p>A dilation with center P and positive scale factor k takes a point A along the ray PA to another point whose distance is k times farther away from P than A is.</p> <p>Dilate <u>(object)</u> using center <u>(point)</u> and a scale factor of <u>(number)</u>.</p> |  <p>$PA' = k \cdot PA$</p> |
| U2, L3 assertion | <p>The dilation of a line segment is longer or shorter according to the same ratio given by the scale factor.</p> |  <p>$PC:PC' = 3:1, BC:B'C' = 2:\frac{2}{3}$</p> |
| U2, L4 assertion | <p>If a figure is dilated, then corresponding angles are congruent.</p> |  <p>$\triangle A'B'C'$ is a dilation of $\triangle ABC$ so $\angle B \cong \angle B'$</p> |
| U2, L4 theorem | <p>A dilation takes a line not passing through the center of the dilation to a parallel line, and leaves a line passing through the center unchanged.</p> |  <p>Dilate using center C. $DE \parallel D'E'$</p> |
| U2, L5 theorem | <p>If a line divides two sides of a triangle proportionally, the line must be parallel to the third side of the triangle.</p> |  <p>$\frac{1}{2} = \frac{1.2}{2.4}$ so $AC \parallel GF$</p> |

| Date, Type | Statement | Diagram |
|----------------------|---|---|
| U2, L6 definition | One figure is similar to another if there is a sequence of rigid motions and dilations that takes the first figure so that it fits exactly over the second. |  <p>Translation and dilation takes $\triangle ABC$ onto $\triangle FDE$ so $\triangle ABC \sim \triangle FDE$</p> |
| U2, L7 theorem | If two triangles have all pairs of corresponding angles congruent and all pairs of corresponding side lengths in the same proportion, then the two triangles are similar. |  <p>$\angle A \cong \angle C$, $\angle D \cong \angle B$, $\angle DEA \cong \angle BEC$, $\frac{AD}{CB} = \frac{DE}{BE} = \frac{EA}{EC}$ so $\triangle DEA \sim \triangle BEC$</p> |
| U2, L8 theorem | All circles are similar. |  |
| U2, L9 theorem | Angle-Angle Triangle Similarity Theorem: In two triangles, if two pairs of corresponding angles are congruent, then the triangles must be similar. |  <p>$\angle A \cong \angle C$, $\angle DEA \cong \angle BEC$, so $\triangle DEA \sim \triangle BEC$</p> |
| U2, L16 theorem | Pythagorean Theorem: If a right triangle has legs with lengths a and b and hypotenuse with length c , then $a^2 + b^2 = c^2$. |  <p>$a^2 + b^2 = c^2$</p> |

| Date, Type | Statement | Diagram |
|-----------------------|---|--|
| U3, L6 definition | The cosine of an acute angle in a right triangle is the ratio (quotient) of the length of the adjacent leg to the length of the hypotenuse. |  $\cos(\theta) = \frac{\text{adjacent}}{\text{hypotenuse}}$ |
| U3, L6 definition | The sine of an acute angle in a right triangle is the ratio (quotient) of the length of the opposite leg to the length of the hypotenuse. |  $\sin(\theta) = \frac{\text{opposite}}{\text{hypotenuse}}$ |
| U3, L6 definition | The tangent of an acute angle in a right triangle is the ratio (quotient) of the length of the opposite leg to the length of the adjacent leg. |  $\tan(\theta) = \frac{\text{opposite}}{\text{adjacent}}$ |
| U3, L10 definition | The arccosine of a number between 0 and 1 is the measure of an acute angle whose cosine is that number. |  $\arccos\left(\frac{\text{adjacent}}{\text{hypotenuse}}\right) = \theta$ |
| U3, L10 definition | The arcsine of a number between 0 and 1 is the measure of an acute angle whose sine is that number. |  $\arcsin\left(\frac{\text{opposite}}{\text{hypotenuse}}\right) = \theta$ |

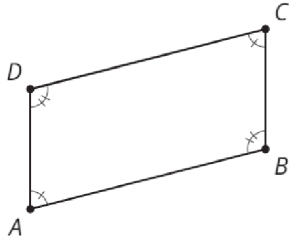

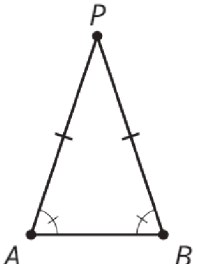

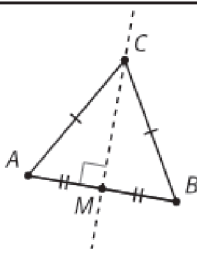

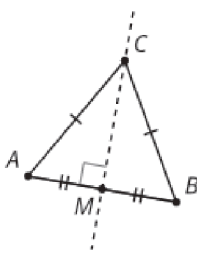

| Date, Type | Statement | Diagram |
|-----------------------|---|--|
| U3, L10 definition | The arctangent of a positive number is the measure of an acute angle whose tangent is that number. |  $\arctan\left(\frac{\text{opposite}}{\text{adjacent}}\right) = \theta$ |
| U7, L6 assertion | Inscribed Angle Theorem: The measure of an inscribed angle is half the measure of the central angle that defines the same arc. |  $m\angle BCA = \frac{1}{2}m\angle BOA$ |
| U7, L7 theorem | A line is tangent to a circle if and only if it is perpendicular to the radius drawn to the point of tangency. |  $\overline{AB} \perp \ell$ |
| U7, L9 theorem | The three perpendicular bisectors of the sides of a triangle meet at a single point, called the triangle's circumcenter . This point is the center of the triangle's circumscribed circle. |  |
| U7, L11 theorem | The three angle bisectors of a triangle meet at a single point, called the triangle's incenter . This point is the center of the triangle's inscribed circle. |  |

| Date, Type | Statement | Diagram |
|-----------------------|---|---|
| U7, L12 theorem | To calculate the area of a sector or the length of an arc , first find the fraction of the circle represented by the central angle of the arc or sector. Multiply this fraction by the circle's area or circumference. |  <p>arc length: 3π cm sector area: 6π cm²</p> |
| U7, L15 definition | For any angle, imagine drawing a circle with the angle's vertex at its center. Then, the " radian measure of the angle" is the ratio of the length of the arc defined by the angle to the circle's radius. That is, $\theta = \frac{\text{arc length}}{\text{radius}}$. |  |
| | | |
| | | |
| | | |

| type, number | statement | diagram |
|-----------------|--|--|
| Assertion 1 | <p>A rigid transformation is a translation, reflection, rotation, or any sequence of the three.</p> <p>Rigid transformations take lines to lines, angles to angles of the same measure, and segments to segments of the same length.</p> | |
| Definition 2 | <p>One figure is congruent to another if there is a sequence of translations, rotations, and reflections that takes the first figure exactly onto the second figure.</p> <p>The second figure is called the image of the rigid transformation.</p> | <p>$\triangle EDC \cong \triangle E'D'C'$</p> |
| Definition 3 | <p>Reflection is a rigid transformation that takes a point to another point that is the same distance from the given line, is on the other side of the given line, and so that the segment from the original point to the image is perpendicular to the given line.</p> <p>"Reflect <u>(object)</u> across line <u>(name)</u>."</p> | <p>Reflect A across line m.</p> |
| Definition 4 | <p>Translation is a rigid transformation that takes a point to another point so that the directed line segment from the original point to the image is parallel to the given line segment and has the same length and direction.</p> <p>"Translate <u>(object)</u> by the directed line segment <u>(name or from [point] to [point])</u>."</p> | <p>Translate A by the directed line segment v.</p> |
| Definition 5 | <p>Rotation is a rigid transformation that takes a point to another point on the circle through the original point with the given center. The two radii to the original point and the image make the given angle.</p> <p>"Rotate <u>(object)</u> (clockwise or counterclockwise) by <u>(angle or angle measure)</u> using center <u>(point)</u>."</p> | <p>Rotate P counterclockwise by a° using center C.</p> |

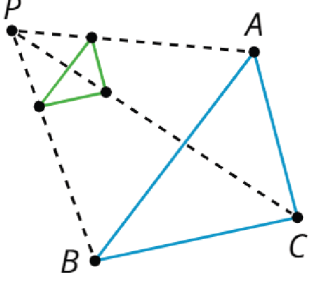

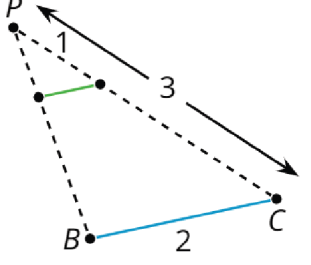

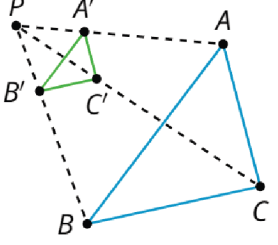

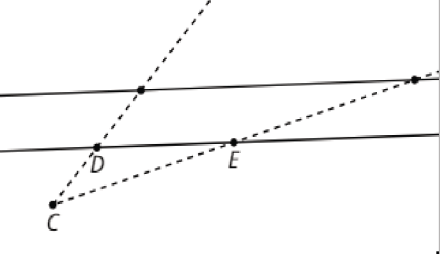

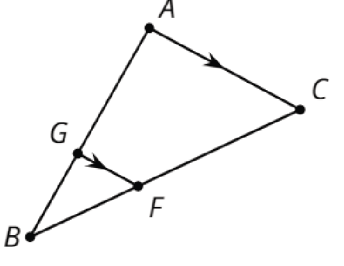

| type, number | statement | diagram |
|-----------------|--|---|
| Assertion 6 | Parallel Postulate: Given a line m and a point A that is not on m , there is exactly one line that goes through A that is parallel to m . |  |
| Theorem 7 | Translations take lines to parallel lines or to themselves. |  |
| Theorem 8 | If two segments have the same length, then they are congruent. |  $AB=CD$, so $\overline{AB} \cong \overline{CD}$ |
| Theorem 9 | If two figures are congruent, then corresponding parts of those figures must be congruent |  $\triangle PQR \cong \triangle DEF$ so $PQ=DE$, $PR=DF$, $QR=EF$, $\angle P \cong \angle D$, $\angle Q \cong \angle E$, $\angle R \cong \angle F$ |
| Theorem 10 | If all pairs of corresponding sides and all pairs of corresponding angles are congruent, then the triangles must be congruent. |  $AB=DE$, $BC=EF$, $CA=FD$, $\angle B \cong \angle E$, $\angle A \cong \angle D$, $\angle C \cong \angle F$ so $\triangle ABC \cong \triangle DEF$ |

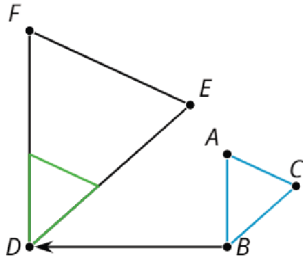

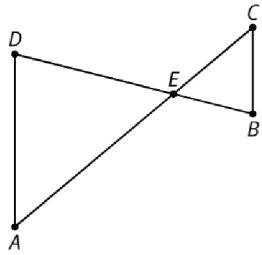

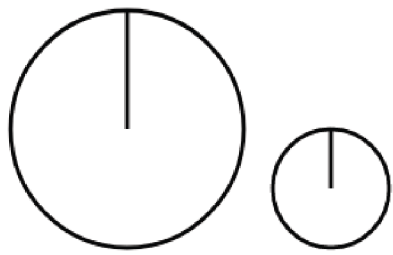

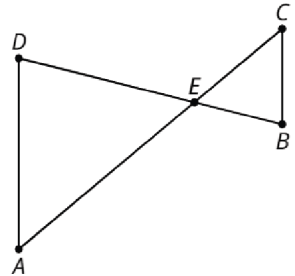

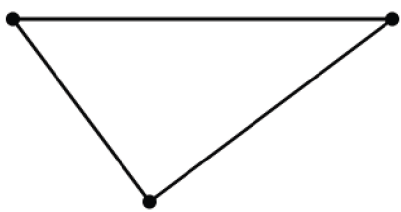

| type, number | statement | diagram |
|------------------|---|--|
| Theorem 11 | Side-Angle-Side Triangle Congruence Theorem: In two triangles, if two pairs of congruent corresponding sides and the pair of corresponding angles between the sides are congruent, then the two triangles are congruent. | <p>$AB=GB, BC=BC, \angle ABC \cong \angle GBC$ so $\triangle ABC \cong \triangle GBC$</p> |
| Theorem 12 | Angle-Side-Angle Triangle Congruence Theorem: In two triangles, if two pairs of corresponding angles, and the pair of corresponding sides between the angles, are congruent, then the triangles must be congruent. | <p>$\angle A \cong \angle C, AE=EC, \angle DEA \cong \angle BEC,$ so $\triangle DEA \cong \triangle BEC$</p> |
| Theorem 13 | Side-Side-Side Triangle Congruence Theorem: In two triangles, if all three pairs of corresponding sides are congruent, then the triangles must be congruent. | <p>$HU=HJ, UG=JG, HG=HG$ so $\triangle HUG \cong \triangle HJG$</p> |
| Definition 14 | A parallelogram is a quadrilateral with two pairs of opposite sides parallel. | <p>$NM \parallel KL, NK \parallel ML$, so $MNKL$ is a parallelogram</p> |
| Theorem 15 | In a parallelogram, pairs of opposite sides are congruent. | <p>$MNKL$ is a parallelogram, so $NM=KL, NK=ML$</p> |

| type, number | statement | diagram |
|-----------------|--|--|
| Theorem 16 | In a parallelogram, opposite angles are congruent. |  <p>$ABCD$ is a parallelogram, so $\angle A \cong \angle C$, $\angle D \cong \angle B$</p> |
| Theorem 17 | Isosceles Triangle Theorem: In an isosceles triangle, the base angles are congruent. |  <p>$AP=PB$ so $\angle A \cong \angle B$</p> |
| Theorem 18 | If a point C is the same distance from A as it is from B , then C must be on the perpendicular bisector of AB . |  <p>$AC=BC$, M is the midpoint, so $MC \perp AB$</p> |
| Theorem 19 | If C is a point on the perpendicular bisector of segment AB , the distance from C to A is the same as the distance from C to B . |  <p>$AB \perp CM$, $AM=BM$, so $AC=BC$</p> |
